Software engineer building AI systems that hold up in production: spec-driven agent workflows, AI-ready repo scaffolding, and the evals and guardrails that keep agents reliable.

## Experience

**Fidelity Investments · Full Stack Software Engineer** — Jan 2023 – Present

*AI-driven development · 2026 – present*

- Drove my area's Claude Code proofs of concept with a director-level engineering group, which led senior management to approve Claude Code for other teams.
- Led a spec-driven development proof of concept (GitHub Copilot agents) converting C# code to Angular; demoed to senior management with at least a 50% reduction in effort.
- Designed and solo-built repo-agnostic scaffolding for AI-ready repositories (agents, subagents, skills, instructions, prompts and tools), shipped as a plugin that auto-loads for every developer in the business area; onboarded the team and presented the architecture to directors and architects.
- Harness engineering and evals: guardrail hooks, progressive disclosure, multi-agent workflows against context rot, token optimization; two-layer tests (deterministic checks plus LLM-as-judge) with negative controls and ablations.
- Built AI SDLC tooling (a story-refinement UI, GitHub Copilot SDK integration, live Playwright testing) and wrote the area's AI usage best practices.
- Designing a cross-app caching and data-sharing gateway to cut duplicate service calls, working through architecture review with prototypes (shared worker vs. middle-man gateway).

*Frontend platform · 2023 – 2026*

- Built 5+ reusable Angular libraries in an Nx monorepo, including the common toolbar, adopted by 5+ teams; built monorepo-wide data stores that made data-heavy views load about 3x faster (perceived).
- Modernized end-to-end testing: migrated Cypress suites to Playwright, built reusable helpers, automated 40+ Xray tests and removed flaky tests, stabilizing Jenkins CI.
- Wrote RFCs and code review standards for reactive state and performance; upgraded Angular and AG Grid.

## Projects · Blindly (independent studio)

- **claude-harness-toolkit** (private): adversarial spec and plan review across 17 defect-class lenses with convergence detection; one command replaces a dozen manual passes. Caught 11 of 11 planted defects blind.
- **universal-memory** (open source): self-hosted MCP memory server shared by Claude Code, ChatGPT and Codex; markdown plus a vector index, eval-tuned deduplication, multi-arch Docker images with CI-gated releases.
- **edge-catcher** (open source): Python research pipeline, one codebase from backtest to paper trading, gated on bit-exact replay/live parity; LLM client with prompt caching and budget caps; 1,000+ mocked CI tests.
- Also **fleet-watchdog** (Cloudflare Workers dead-man's switch), **claude-state-drift**, **attune** and **ai-x-feed**.

## Skills

**AI engineering:** Claude Code (plugins, hooks, subagents), multi-agent workflows, MCP, OpenSpec, evals, LLM-as-judge
**Languages:** TypeScript, JavaScript, Python, Java, SQL
**Frameworks and platforms:** Angular, RxJS, Nx, AG Grid, Node.js, FastAPI, Spring, MyBatis, Cloudflare Workers
**Testing and ops:** TDD, Playwright, Cypress, Jasmine/Karma, Jest, pytest, JUnit, Docker, GitHub Actions, Jenkins

## Education

**University of Massachusetts Amherst** · B.S., Computer Science — 2022

## Earlier experience

**State Street · Intern** · IT (2018) and Securities Finance (2021) — 2018, 2021
