

Software engineer building AI systems that hold up in production. At Fidelity Investments since 2023, I moved from frontend platform engineering to AI-driven development: spec-driven agent workflows, AI-ready repo scaffolding, and the evals and guardrails that keep agents reliable.

Experience

Fidelity Investments · Software Engineer

Jan 2023 – Present

AI-driven development · 2026 – present

- Member of my area's AI pilot group, whose work and feedback helped get Claude Code approved for other teams.
- Led a spec-driven development proof of concept (OpenSpec, AI agents) converting C# code to Angular; demoed to senior management with at least a 50% reduction in effort.
- Designed and solo-built repo-agnostic scaffolding for AI-ready repositories (agents, subagents, skills, instructions, prompts and tools), shipped as a plugin that auto-loads for every developer in the business area.
- Harness engineering: guardrail and realignment hooks, progressive disclosure for skills, multi-agent workflows against context rot, memory injection, token optimization, and skills for autonomous development loops.
- Built eval infrastructure for those skills and agents: two-layer tests (deterministic script and regex checks plus LLM-as-judge) with scoring, negative controls and ablations.
- Built AI SDLC tooling (a story-refinement UI, GitHub Copilot SDK integration, live Playwright testing) and wrote the area's AI usage best practices.
- Designing a cross-app caching and data-sharing gateway, answering architecture review with working prototypes.

Frontend platform · 2023 – 2026

- Built 5+ reusable Angular libraries in an Nx monorepo, including the common toolbar, adopted by 5+ teams.
- Built monorepo-wide data stores that made data-heavy views load about 3x faster (perceived); upgraded Angular and AG Grid; prototyped Module Federation.
- Integrated an LLM end to end into the monorepo to generate API documentation automatically.
- Quality and operations: Jasmine/Karma, Cypress and Playwright suites; ESLint and SonarQube gates in Jenkins; Datadog monitors; on-call. Resolved a production incident by scripting crash and version collection, shipping fallbacks, and isolating the causes outside the team's control.

Projects · Blindly (independent studio)

- **claude-harness-toolkit** (private): adversarial spec and plan review for Claude Code and Codex across 17 defect-class lenses, with automatic convergence detection. Caught 11 of 11 planted defects in blind validation.
- **universal-memory** (open source): self-hosted, markdown-first memory for LLM agents across devices and sessions, served over MCP. Also private MCP servers for workout (OAuth) and personal-finance data.
- **fleet-watchdog** (private): dead-man's switch for a Raspberry Pi fleet; a Cloudflare Worker alerts when heartbeats stop, so a dead box can't silence its own alarm.
- **claude-state-drift**, **attune**, **edge-catcher**, **ai-x-feed** (open source): session-state layer for Claude Code, explanation-tuning Claude plugin, prediction-market research pipeline, live AI digest.

Skills

AI engineering: Claude Code (plugins, hooks, skills, subagents), multi-agent workflows, OpenSpec, MCP, evals, LLM-as-judge, Copilot SDK

Languages: TypeScript, JavaScript, Java, SQL, Python

Frameworks and platforms: Angular, RxJS, Nx, AG Grid, AG Charts, Node.js, Spring, MyBatis, JDBC, Cloudflare Workers

Testing and ops: Playwright, Cypress, Jasmine/Karma, Jest, JUnit, Vitest, SonarQube, Jenkins, Datadog

Education

University of Massachusetts Amherst · B.S., Computer Science

2022

Earlier experience

State Street · Intern · IT (2018) and Securities Finance (2021)

2018, 2021
