WORK EXPERIENCE

Fidelity Investments Boston, MA

Full Stack Software Engineer Jan. 2023 - Present

- Drove Claude Code proofs of concept with a director-level engineering group on a spec-driven loop; the results got Claude Code approved for other teams
- Led an AI-driven C#-to-Angular migration POC (GitHub Copilot + spec-driven development) for senior leadership, cutting effort by at least 50%; demoed to senior management and directors
- Designed and solo-built repo-agnostic scaffolding for AI-ready repos (agents, sub-agents, skills, instructions, prompts, tools), shipped as a plugin that auto-loads for every developer in the business area; onboarded the team and presented the architecture to directors and architects
- Harness engineering and evals: guardrail hooks, progressive disclosure, multi-agent orchestration against context rot, token optimization; two-layer evals (deterministic checks + LLM-as-judge) with ablations
- Built AI SDLC tooling (story-refinement UI, GitHub Copilot SDK integration, live Playwright testing) and wrote the area's AI usage best practices
- Designing a cross-app caching and data-sharing gateway to cut duplicate service calls, working through architecture review with prototypes (shared worker vs. middle-man gateway)
- Architected 5+ reusable Angular libraries (incl. the common toolbar) and micro-frontend patterns adopted by 5+ teams; built monorepo-wide data stores that made data-heavy views ~3x faster
- Modernized e2e testing: migrated Cypress suites to Playwright, built reusable helpers, automated 40+ Xray tests, eliminated flaky tests, and stabilized Jenkins CI
- Authored RFCs and code-review standards for reactive state and performance; partnered with principal engineers on feature-flag governance and architecture blueprints

State Street Bank and Trust Company Boston, MA

Informational Technology Intern & Securities Finance Intern Summer 2018 & Summer 2021

EDUCATION

UMass Amherst – B.S. Computer Science, GPA: 3.6 Class of 2022

PROJECTS

claude-harness-toolkit – Claude Code Plugin

- Multi-agent spec and plan review orchestrator for Claude Code and Codex that rotates 17 defect-class lenses with deterministic convergence detection, replacing a dozen+ manual review passes with one command; caught 11 of 11 planted defects in blind validation

edge-catcher – LLM-Driven Research Framework github.com/goldenwo/edge-catcher

- Python framework with a four-stage hypothesis-to-production pipeline enforcing bit-exact replay/live parity as a merge gate; multi-backend LLM client with prompt caching and per-call USD budget caps; 1,000+ fully-mocked CI tests

universal-memory – Cross-Vendor AI Memory MCP Server

- MCP server built from scratch: one memory store unifying Claude Code/Desktop, ChatGPT, and Codex; two-tier markdown + vector model for zero vendor lock-in; eval-tuned deduplication; multi-arch Docker image with CI-gated releases

SKILLS

AI / Agent Tooling: Claude Code (skills, hooks, sub-agents, plugins), Model Context Protocol (MCP), multi-agent orchestration, evals (LLM-as-judge), OpenSpec, prompt caching, spec-driven development

Languages / Frameworks: TypeScript, Python, Angular, RxJS, Nx, FastAPI, React, Node.js, Java (Spring Boot), SQL/Postgres

Testing / Infra: TDD, Playwright, Cypress, Jest, pytest, mypy, CI/CD, Docker, GitHub Actions, Jenkins, Git
